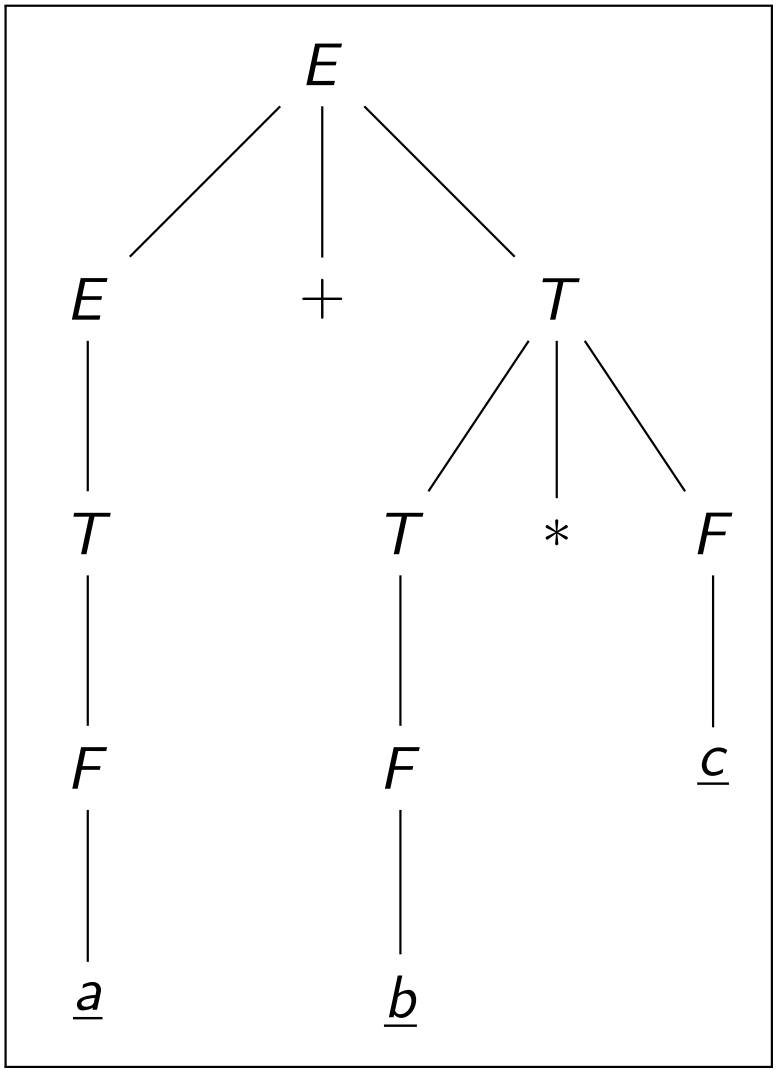
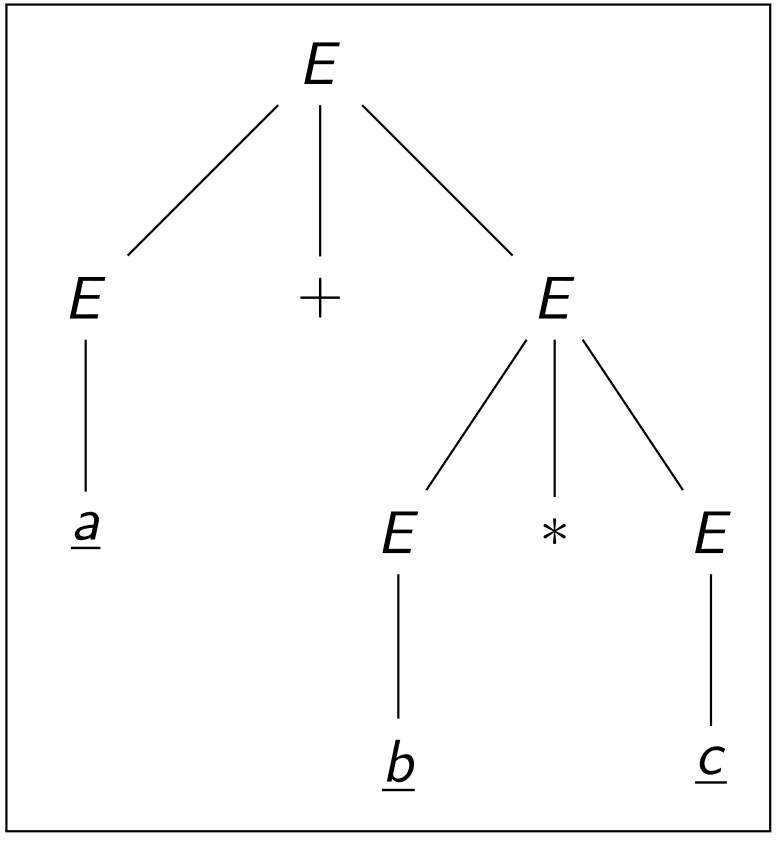
Parse tree and abstract syntax tree

Parse tree in unambiguous grammar:



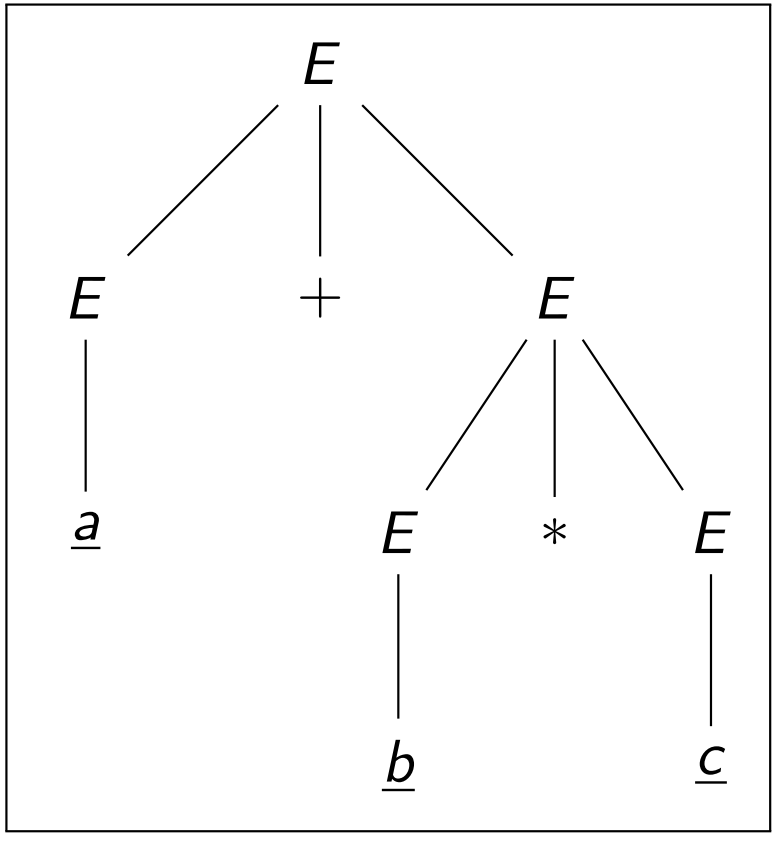
Parse tree and abstract syntax tree

Parse tree in ambiguous grammar:

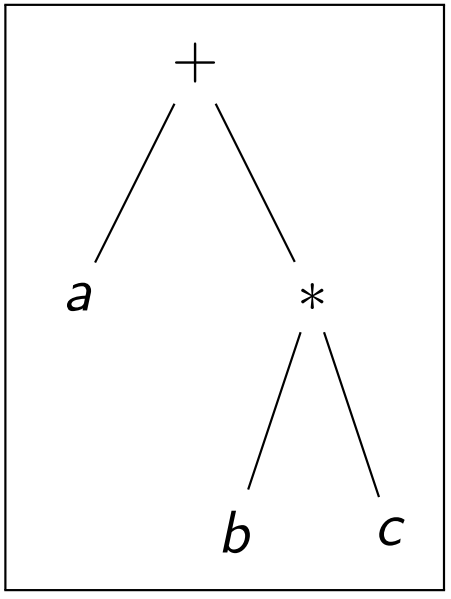


Parse tree and abstract syntax tree

Parse tree in ambiguous grammar:



Abstract syntax tree (AST):



AST definition

```
...
class BinExpr(Node):
    def __init__(self, op, left, right):
        self.op = op
        self.left = left
        self.right = right
...
```

```
from dataclasses import dataclass
...
@dataclass
class BinExpr(Node):
    op: str
    left: Node
    right: Node
...
```

Actions in SLY

```
@_('expr "+" expr')
def expr(p):
    return AST.BinExpr(p[1], p[0], p[2])

@_('expr "+" expr')
def expr(p):
    return AST.BinExpr(p[1], p.expr0, p.expr1)
```

Actions in SLY

```
@_('expr "+" expr',
   'expr "-" expr',
   'expr "*" expr',
   'expr "/" expr')
def expr(p):
    return AST.BinExpr(p[1], p[0], p[2])

@_('"(" expr ")"')
def expr(p):
    return p[1]
```

Visitors

	TreePrinter	TypeChecker	Optimizer	...
VarExpr				
NumExpr				
BinExpr				

- Object-oriented style
- Phase-oriented style (syntax separate from interpretations)

Tree printer

```
def addToClass(cls):

    def decorator(func):
        setattr(cls,func.__name__,func)
        return func
    return decorator

class TreePrinter:
...
    @addToClass(AST.BinExpr)
    def printTree(self):
        print(self.op)
        self.left.printTree(indent+1)
        self.right.printTree(indent+1)
...
```
